Communications form 3: receiving data using app.media method (AcroForm)

This form 'receives' data that the user has inputted into form 1.

Name **null**

Company **null**

This AcroForm looks for the app.media property called 'myData'. The following document level JavaScript looks for the app.media property:

```
// get the fields
var vName = this.getField("userName");
var vCompany = this.getField("userCompany");

// set the fields with the property of app.media
vName.value = app.media.myData.oName;
vCompany.value = app.media.myData.oCompany;
```

If the app.media property 'myData' exists, then the two fields are populated with the two variables oName and oCompany. Effectively, data that the user has inputted into form 1, is used here when this form is opened.
